Problem Statement

- Students often face challenges in organizing study schedules and tracking academic tasks effectively. Without a structured system, they may miss deadlines, struggle with time management, and fail to stay consistent in their study routines. There is a need for a simple and efficient tool that helps students plan, track, and manage their study goals with ease.

System Approach

- **Frontend Technologies**:
- HTML → To structure the web pages.
- CSS → To style the layout, colors, and background (with image1.jpg).
- JavaScript → To add interactivity, manage tasks, handle reminders, and store data in Local Storage.

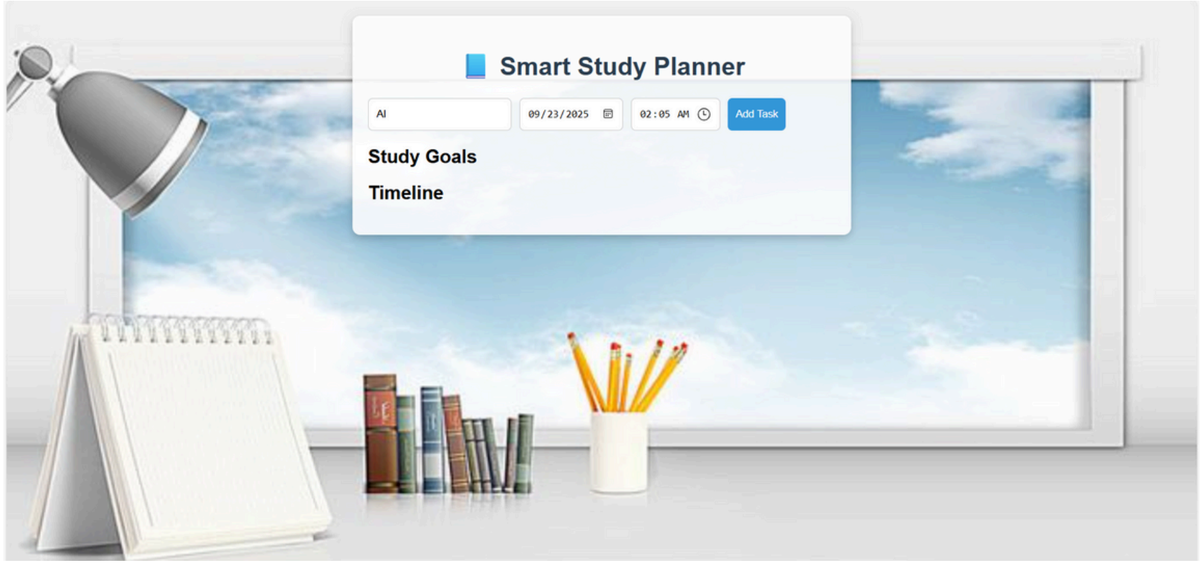

- **Design Approach**:
- Clean and user-friendly interface
- Mobile-responsive design
- Modular separation of HTML, CSS, and JS files

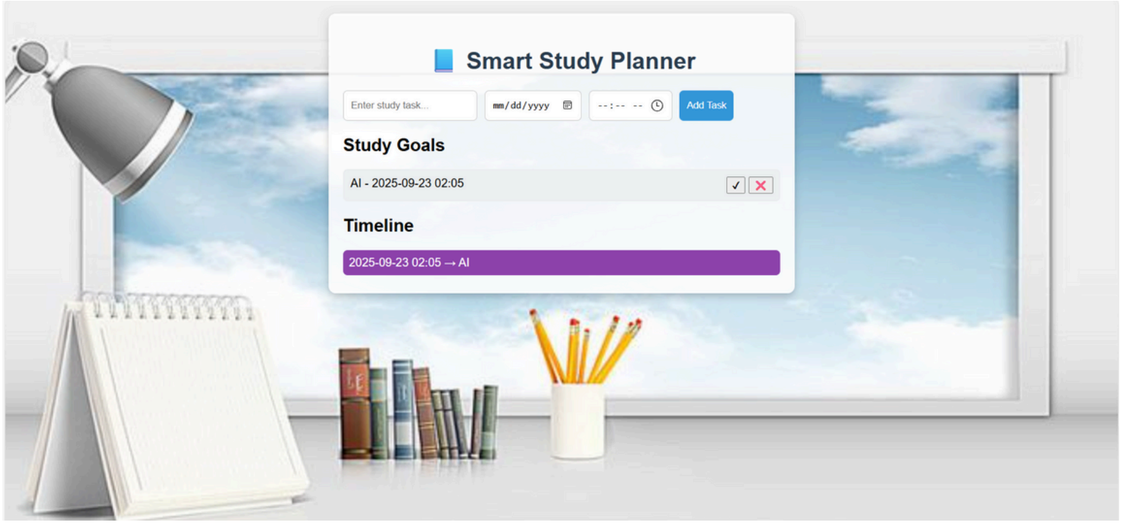

Algorithm & Deployment

- Product Catalog Creation
- Define product categories (e.g., Electronics, Books, Clothing).
- Include product details: image, name, price, and description.
- Frontend Design
- Use HTML for structure and CSS for styling.
- Implement grid layout and product cards for an organized and responsive catalog view.
- Interactive Features (JavaScript)
- Add-to-Cart and Remove-from-Cart functionality.
- Real-time total price calculation for cart updates.
- Product filtering by category for easier browsing.
- Modal views for displaying product details (image, description, price) on click.
- Testing
- Ensure cross-browser compatibility (Chrome, Firefox, Edge, Safari).
- Ensure mobile responsiveness for smooth usage on phones and tablets.

Conclusion

- The Product Catalog & Shopping Cart System provides a simple, interactive, and user-friendly platform for browsing products, viewing details, and managing purchases. By integrating HTML, CSS, and JavaScript, the system ensures an attractive layout, responsive design, and real-time functionality such as add-to-cart, remove-from-cart, total price calculation, and category-based filtering.
- This project successfully demonstrates how a frontend-based e-commerce interface can be developed to enhance the shopping experience while maintaining cross-browser compatibility and mobile responsiveness. It can serve as a foundation for more advanced online shopping applications with backend integration in the future.
